LevelView is a highly innovative real time loudness meter. Its 'Rainbow meter' gives the user continuous insight in recent loudness levels of the program material. The arches of the rainbow all have different integration times: the outer ring shows loudness of the last 3s, every step inward triples the time span. This technique has proven to offer a very convenient monitor view during a mix process.

Outside of the rainbow meter, a faster 'Momentary loudness' meter is shown. Next to the Rainbow the 'Integrated loudness' is shown in large digits. Below this number, a table with all EBU loudness descriptors can be found. And on the left side of the meter a large histogram with Loudness Range indication completes this versatile plugin.

LevelView runs in most DAW's on both Mac and PC. It offers you the finest view on loudness and will surely fascinate your customers.
